Description

Danfoss contactors CI 6-50 cover the power range 2.2-25 kW.

CI 6 is built up as a combined contactor/control relay.

CI 9 DC - 30 DC and CI 9 EI-30 EI are contactors for DC coil voltage within the power range 2.2-15 kW. The range CI 9 EI- CI 30 EI has built-in interface relay for PLC application with 24 V DC output.

Accessories include a wide selection of clip-on auxiliary contact blocks and timers, interface modules and RC links.

The CI 6-50 range also includes thermal overload relays for protection of squirrel-cage motors.

Ordering*Contactors CI 6-50 for AC coil voltage (no built-in auxiliary contacts)*

¹⁾ Suffix defining coil voltage/frequency must be added to the Danfoss code no. (see table on page 5).

²⁾ AC-15 operation: max. 500 VA/6 A

³⁾ U_e max.: 500 V

⁴⁾ The thermal current value I_{th} represents the maximum load at 40°C, which corresponds to installing the contactor in air (open).

⁵⁾ The thermal current value I_{th} represents the maximum load at 60°C, corresponding installing the contactor inside an enclosure.

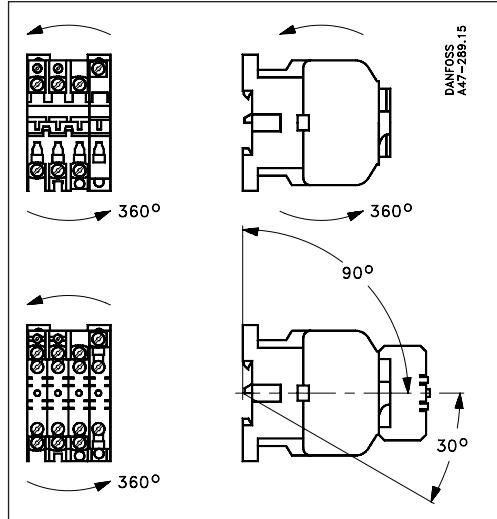

⁶⁾ Heat-resistant leads (min. 75°C) must be used.

A47-391.11

Explanation of graphs

Mean value curves

Upper curve: 3-phase tripping and asymmetric load tripping at min. setting.

Lower curve: Asymmetric load tripping at max. setting.

When tripping from the operationally warm condition, the tripping times are approx. 30% of the values shown. These values apply at an ambient temperature = 20°C.

$$\text{3-phase tripping: } x = \frac{\text{measured current}}{\text{rated motor current}}$$

$$\text{Asymmetric load tripping: } x = \frac{\text{measured current}}{\text{max. scale value on overload relay}}$$

Tripping time $2 < T_p \leq 10$ s at $7.2 \times I_e$ class 10 A
 Note! In general, the thermal overload relay is always set on motor full load current.

3-phase overload

- 1) Measure overload current
- 2) Find the overload factor (x) by dividing the measured value by the set value of the thermal overload relay (motor full load current).
- 3) Find (x) on the horizontal axis and follow a line vertically up until it intersects the upper curve.
- 4) From the intersection point, follow a horizontal line to the left and read off on the vertical axis the time that will elapse before the thermal overload relay cuts out the motor.

Asymmetric load tripping

- 1) Measure the current the motor draws from one of the intact phases.
- 2) Find the overload factor (x) by dividing the measured value by the maximum scale value of the thermal overload relay.
- 3) Find (x) on the horizontal axis and follow a line vertically up until it intersects the lower curve.
- 4) From the intersection point, follow a horizontal line to the left and read off on the vertical axis the time that will elapse before the thermal overload relay switch off the motor.

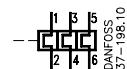

Terminal marking

Terminal marking in Danfoss contactors conforms to **EN 50005**. The idea of this marking is as follows:

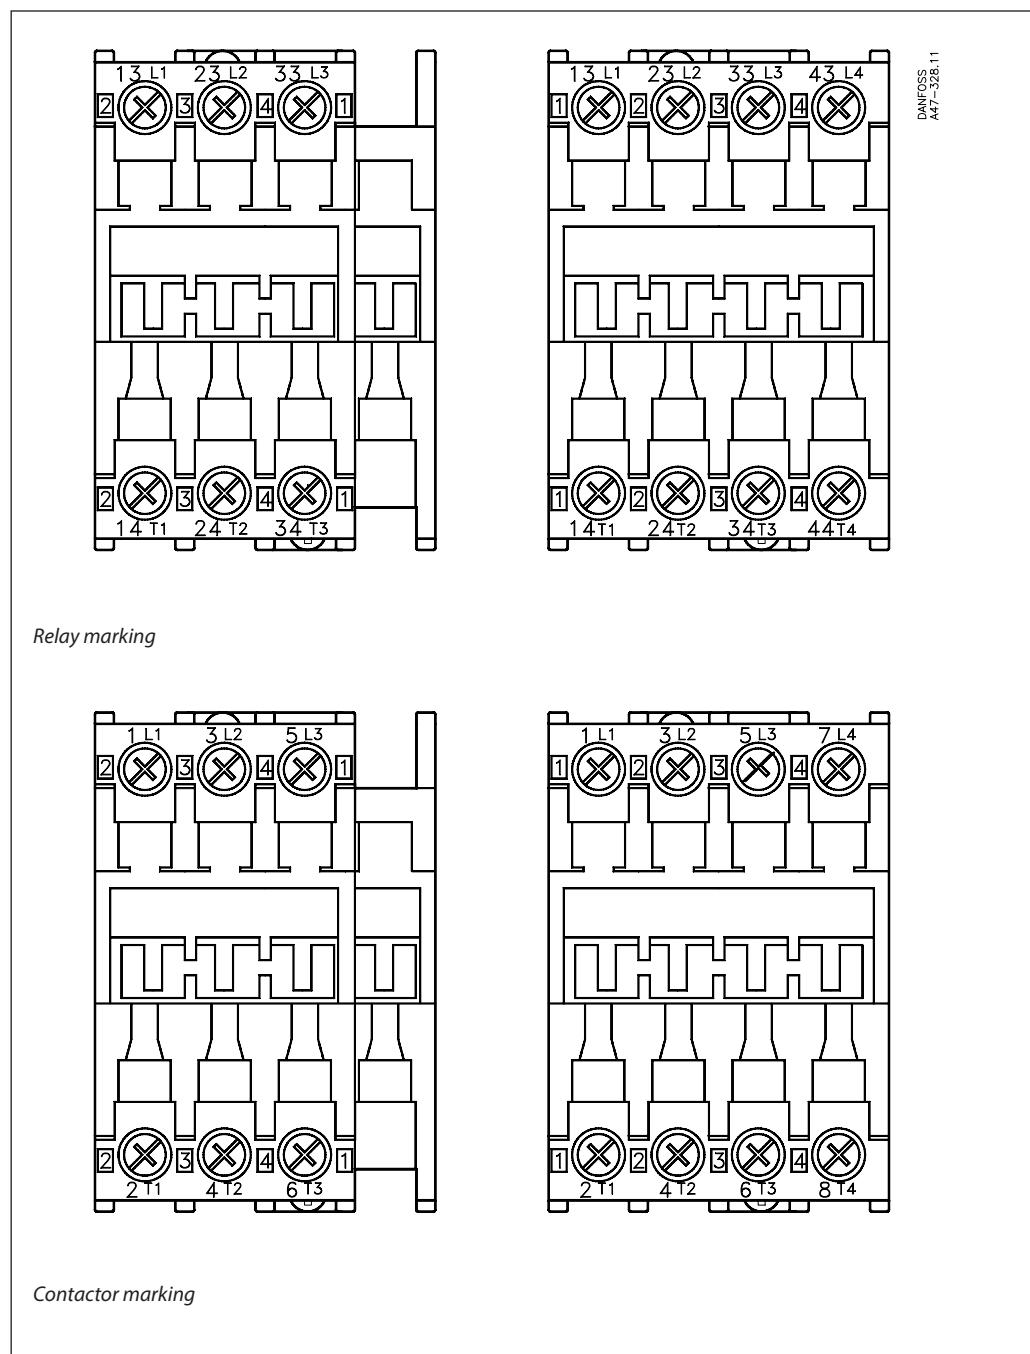

1. From the marking it is possible to read which terminals are associated and which functions the contacts have.
2. Control relays and contactors of different makes but with the same number of contacts must have identical terminal markings.

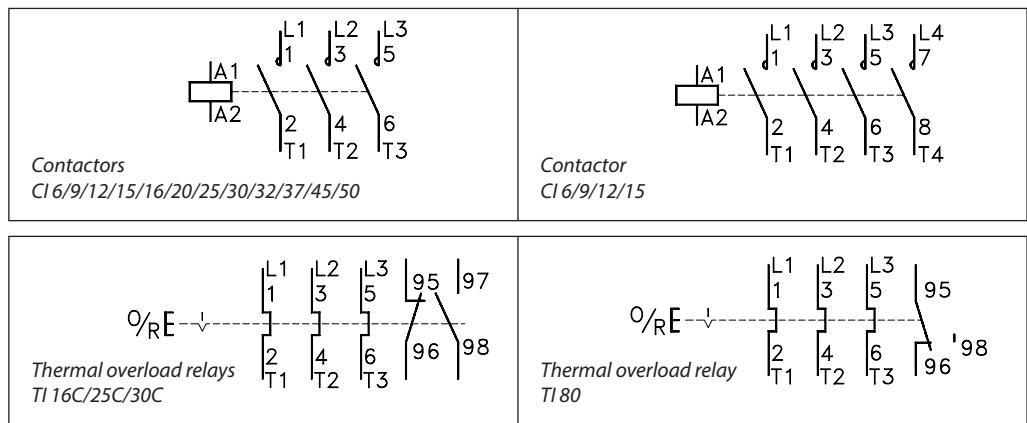

Contact set with three main contacts.

Thermal overload relay with three bimetal elements.

**Loads***Connections, main contacts and contactor coils*
